

## ABSTRACT

5        Isolated peptides, peptidomimetics, and antibodies which bind to the  
viral fusion protein binding domain of the RhoA protein or the RhoA binding  
domain of a viral fusion protein are useful for inhibiting infection in  
susceptible cells, *in vitro* and *in vivo*. Among these viruses are the  
Paramyxovirus respiratory syncytial virus (RSV) and the Lentivirus human  
10    immunodeficiency virus (HIV).
